

WIRELESS FIRE DETECTION

The FireCell RNC or Radio Network Communicator allows you to wirelessly network up to 8 panels seamlessly.

With full network communication across all panels and every device, as well as global "cause and effect" programming, FireCell now provides an easy solution to a complex problem.

- ✓ **Up to 8 FireCell panels**
- ✓ **Up to 4,032 wireless devices**
- ✓ **Fully addressable**
- ✓ **Fully configurable**
- ✓ **Up to 5 years battery life**
- ✓ **5 Year Warranty**

The expense and complexity usually associated with networks is now a thing of the past as communication paths are no longer reliant on cables between buildings. No extensive civil works are needed and the inconvenience and time rich installation works normally associated with a network are totally eradicated.

The risk of cable damage during and after installation is also avoided as are the implications of health and safety issues when protracted ground works are undertaken.

It is now possible to network FireCell across roads and terrain that would be impossible using cable.

In simple terms a FireCell network will reduce costs drastically; additionally the network could be up in hours as opposed to weeks.

How does it work? Each panel on the network will require a wireless RNC and network PCB (installed in the panel).

Once installed configuration of the cause and effect and communication programming is all that is required.
